REPORT

Name	: Mr. B.RAM MOHAN REDDY	Sample ID	: 23152101
Age/Gender	: 38 Years/Male	Reg. No	: 0012201190272
Referred by	: Dr. SELF	SPP Code	: SPL-CV-045
Referring Customer	: NAINIKA DIAGNOSTICS CENTER Covid	Collected On	: 18-Jan-2022 10:00 AM
Primary Sample	: Nasopharyngeal and Oropharyngeal swabs	Received On	: 19-Jan-2022 01:45 PM
Sample Tested In	: Viral Transport Medium	Reported On	: 20-Jan-2022 11:51 AM
Client Address	:	Report Status	: Final Report

MOLECULAR BIOLOGY

Test Name	Results	Units	Ref. Range	Method
SARS-COV-2, Three Genes Multiplex RT PCR				
ORF Gene Ct Value	22.00	NA		RT PCR
S Gene Ct Value	25.00	NA		RT PCR
S Gene Ct Value	28.00			RT PCR
SARS-CoV-2 (COVID-19) Result	Positive	NA		Real Time PCR

Interpretation:

Note :- S gene Detected means Unlikely to be Omicron. If S gene-Not Detected Could be Omicron, full gene analysis must be performed to confirm test.

SARS-CoV-2 is a positive sense, single stranded RNA virus belonging to the family Coronaviridae, causing the disease COVID-19. It is highly contagious and transmitted via droplets and fomites. Clinical presentation ranges from asymptomatic cases to mild, moderate and severe illness and mortality and symptoms may develop 2 days to 2 weeks following exposure to the virus. Risk factors for severe COVID-19 infection may include advanced age, immunocompromised state, Diabetes, Cardiovascular disease, Hypertension, Chronic pulmonary disease, Liver disease, Malignancy, Severe obesity.

This test is a real-time RT-PCR test intended for the qualitative detection of SARS-CoV-2 Nucleic Acid from respiratory samples of individuals suspected of COVID-19 by their health care provider. SARS-CoV-2 RNA is generally detectable in respiratory specimens during the acute phase of infection. This is a multiplex assay that contains three primers/probes - N gene, ORF1ab gene, S gene - that are specific and confirmatory for SARS-CoV-2.

NOTE:

1. ICMR Regd No. For COVID-19 Testing - SAPALAPV1HT
2. All results relate only to the specimen tested and should be correlated with clinical history and radiographical findings.
3. A negative result, particularly from an upper respiratory sample, does not rule out the possibility of COVID-19 infection as presence of inhibitors, mutations and insufficient RNA and other factors can influence the results. Repeat sampling and testing of lower respiratory specimen is strongly recommended in severe or progressive disease.
4. CT Values > 30 is suggestive of borderline Positive and should be correlated clinically. Advised repeat test if clinically indicated.
5. Due to relatively fast molecular evolution of RNA viruses, there is an inherent risk that accumulation of mutations over time may lead to false negative results. Positive results do not rule out bacterial infection or co-infection with other viruses.

Correlate Clinically.
